Macintosh LC III: Control Chips (2/93)

Article Created: 9 February 1993

TOPIC -----

This article describes the Macintosh LC III control chips.

DISCUSSION -----

SONORA

This ASIC performs timing video generation, sound, peripheral decodes, interrupt, DRAM, VRAM, and miscellaneous glue logic functions. Sonora integrates the functions of many separate chips from the LC II into one package, which helps lower cost and improve reliability.

EGRET

A single chip microcontroller (Motorola 68HC05EG) that performs keyboard scanning, real time clock, ADB interface, and parameter RAM storage. The Macintosh LC III can be reset via the keyboard by holding down the Control and Command keys then hitting the power key. An interrupt is generated by holding just the Command key and pressing the power key.

COMBO

The SCSI and serial interfaces are handled by the 85C80 Combo chip as in previous Macintosh models.
