Macintosh LC: Security Connector

Article Created: 14 May 1991

Article Last Reviewed: 23 July 1992

Article Last Updated:

TOPIC -----

The new Macintosh LC seems to have a different type of molded-in security "hole".

Previous Macintosh computers had a hole that would accommodate a clip-in metal eye through which a cable could be run and padlocked to a table. The Macintosh LC has a different kind of security connector, a "slot".

Is the security slot on the Macintosh LC the same as that on keyboards, and will the same gadgets that I now use for the keyboard still work?

DISCUSSION -----

The security connector on the Macintosh LC is best described as an underpass where the security cable would pass under a small bridge of plastic on the underside of the case.

It does not use the plug-in connector as does the Macintosh Plus keyboard. Copyright 1991 Apple Computer, Inc.
