- Separated unrelated information into another article.

### TOPIC -----

The Macintosh Family Hardware Reference (Addison-Wesley) states at the end of the Macintosh Plus section that all late model Macintosh Plus systems have a dual-voltage 50/60 Hz 110-120/220-240VAC power supply that comes preset to 110-120VAC but can be changed to the higher voltage via a switch on the analog board. I can't find it the switch. Is this a publication error, or is the switch really there?

### DISCUSSION -----

Only international versions of the Macintosh Plus ship with the dual-voltage 50/60 Hz 110-120/220-240VAC power supplies. The domestic version of the Macintosh Plus system ships with the 50/60 Hz 110-120VAC power supply.

The information to which you are referring is on page 7-2 of the Macintosh Family Hardware Reference and is incorrect.
