PowerBook 1400: 1400 Demo Processor speed (3/97)

Article Created: 10 March 1997

TOPIC -----

I just purchased a Powerbook 1400/133mHz. When I run the "PowerBook 1400 Demo" from my hard drive and click on "SPECS", it states I have a 117mHz processor? Have I been given the wrong unit?

DISCUSSION -----

The "PowerBook 1400 Demo" is merely an interactive presentation to show the features of the 1400. It is not intended to be a diagnostic tool or system profiler. Most likely, the presentation was written before the 133 mHz processors were part of the 1400 product line.

To confirm the speed of your processor, you may run Apple System Profiler, available with Mac OS 7.6 or online at Apple Software Updates.
