## PowerBook: HDI-30 Throughput (7/92)

Article Created: 7 November 1991
Article Reviewed/Updated: 31 July 1992

TOPIC -------------------------------------------------------------

I would like to match external hard disks to the Macintosh PowerBook 140 and
170.  Can you tell me the throughput of the SCSI port on these PowerBooks?

DISCUSSION --------------------------------------------------------

The SCSI circuitry used on the Macintosh PowerBooks (and consequentially, the
throughput of the port) is the same as that used in all Macintosh computers.
The new HDI-30 SCSI port connector has the same signals as the DB-25 connector,
and the HDI-30 throughput is the same as other Macintosh computers.

Hard disks compatible with the Macintosh IIci, for example, work with the
Macintosh PowerBooks.
