TOPIC -----------------------------------------------------------
```

Can I mix and match SIMM speeds when upgrading memory on my Macintosh?

```
DISCUSSION ------------------------------------------------------
```

As a general rule, SIMM speeds should match within a bank, can be different
between banks, and all must be compatible for the specific Macintosh model. In
other words, as long as all the SIMMs in Bank A match in speed, all the SIMMs
in Bank B match, and all the SIMMs in the system are at least 120ns, you should
have no problem.
