TOPIC -----

Why can't I run the TokenTalk NB Card User Confidence Test on my Macintosh IIci?

DISCUSSION -----

The TokenTalk NB Card User Confidence Test cannot run on any Macintosh that requires system software version 6.0.4 or later because of a code conflict problem. The Confidence Test ships with version 6.0.3 and was designed to start up as a diagnostic.

If you copy the test to a startup disk or a Macintosh hard drive running version 6.0.4 or later, the system software loads the test code incorrectly into system RAM. The upshot of this is that the test either fails the card or hangs the Macintosh in the process of running the test.

Users should run the test only on a Macintosh that can start up the test disk. There is no other workaround.
