MicroExplorer: Compatible with NuBus

This article last reviewed: 8 September 1989

TOPIC -----

Does the Texas Instruments MicroExplorer work in the Macintosh IIX and the Macintosh IICX?

DISCUSSION -----

The Texas Instruments MicroExplorer is NuBus-compatible. It will work with the Macintosh II, the Macintosh IIX and the Macintosh IICX.

The MicroExplorer card comes with 4MB of memory but is usually configured with an additional 4MB of memory. This extra memory comes on an expansion board that takes the space of a second slot although it does not use a connector. In the Macintosh II and the Macintosh IIX, two slots are used. Because there are only three slots in the Macintosh IICX, Texas Instruments bends a pin so that the MicroExplorer only uses one slot. You can then use two additional cards in the Macintosh IICX.

Unless you want only 4MB of memory, the Macintosh IICX configuration must be purchased from Texas Instruments as a system because they bend the pin. The Macintosh II and the Macintosh IIX configuration can be bought as a package, or the card can be bought separately.
