Macintosh II, IIX & IIfx: Auto-Power-On Device

Article Created: 30 August 1989
Article Last Reviewed: 21 July 1992
Article Last Updated: 24 July 1992

TOPIC -----

I need a device that can automatically start a Macintosh II (or Macintosh IIX and IIfx) following a power outage and that can start the computer at a specified time.

DISCUSSION -----

The only solution we know of is a NuBus card called MacClock II from MacSema. MacClock II contains a real-time clock with battery. It also restarts the computer when power is applied to the electrical circuit (as would be the case when power comes back on after an outage). MacClock II also starts a Macintosh system at a specified time and can execute macros via programs like Tempo II and QuicKeys.

To locate a vendor's address and phone numbers, use the vendor name as a search string.
