DEC LQPO2 Daisy Wheel Printer: Pinouts for Macintosh

This article last reviewed: 19 February 1991

TOPIC ---

I'm trying to hook up a Digital LQP02 serial daisywheel printer to a
Macintosh SE.

The pin-outs are:

```
    LQP02 Digital                        Macintosh SE

   Pin #                                Pin #
    1      shield                         1       HSKO
    2      Tx data                        2       HSKi
    3      Rx data                        3       TxD-
    6      Data Set Ready                 4       GND
    7      Signal ground                  5       RXD-
   20      DTR                            6       TxD+
                                          7       GPi
                                          8       RxD+
```

Which pins goes to which connection?

I understand that the grounds go together. What about the shield? Do I
really need it? The Tx goes to Rx, but the + and - TxD, RxD on the
Macintosh side was a little confusing.

DISCUSSION --

Use the negative TxD and RxD on the Macintosh side. Also, use the shield.
