Power Macintosh: Using NEC Multisync Monitors (2/95)

Article Created: 07 July 1994

Article Reviewed/Updated: 13 February 1996

TOPIC -----

After starting up a Power Macintosh with an NEC multisync monitor, the only resolution available from the Monitors control panel is 640x480. Does the Power Macintosh support resolution switching with NEC monitors?

DISCUSSION -----

The Power Macintosh supports "on the fly" resolution switching with many third-party multisync monitors (also called multiple scan displays). However, an adapter is required so the Macintosh can detect the proper multisync mode.

For NEC monitors, there is an adapter named "Power Macintosh Adapter" which lets you change resolutions through the Monitors control panel, like you would if you owned an Apple Multiple Scan Display. NEC adapters are available by calling NEC.

Macintosh Centris, Quadra, or LC Owners

=====

With a Centris, Quadra or LC, you can use NEC's "DPI on the fly" software which provides a similar ability to change resolutions.

The "DPI on the fly" software is not compatible with the Power Macintosh.

To locate a vendor's address and phone number, use the vendor name as a search string.
