## HyperCard: Where To Get AppleTalk XCMD Programming Help

This article last reviewed: 27 February 1990

TOPIC -----

I want to write an XCMD to find all of the available nodes on a network. I read in "Inside AppleTalk" about GetZoneList and ReceiveZoneList, but I'm not sure how to access these calls in my program. Can you help?

DISCUSSION -----

On AppleLink, there is sample source code, in Pascal, that demonstrates how to use the ZIP command "GetZoneList". Here is the path (available to all AppleLink subscribers):

Developer Services  
Macintosh Developer Technical Support  
Sample Code  
SC.011.GetZoneList

Also, APDA sells a product called "HyperCard AppleTalk Toolkit v. 2.5" that includes XCMDs, XFCNs, and source code (in C) for accessing AppleTalk networks. However, none of these XCMDs or XFCNs implements ZIP (Zone Information Protocol). For more details, search the Technical Info library under "APDA." Copyright 1990 Apple Computer, Inc.
