HyperCard: Script to Go Back to Previous Stack (7/92)

Article Created: 16 January 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ---

The handler GoBackStack takes you back to the stack you were in before the
current one. It uses information that is saved by rememberStack.

RememberStack is called from the closeStack handler in this stack. That
means you can only go back to stacks that pass closeStack, so make sure all
your favorite stacks do so.

DISCUSSION ---

```
on rememberStack
  global backTrackStacks
  get short name of this stack
  if it is not last line of backTrackStacks -- prevent consecutive duplicates
  then put it & return after backTrackStacks
end rememberStack

on goBackStack
  global backTrackStacks
  get backTrackStacks
  put last line of it into dest
  delete last line of it
  if dest is empty then go home else go to stack dest
  put it into backTrackStacks -- global changed during go
end goBackStack
```
