## HyperCard: sharedhilite to True May Limit Button Control (7/92)

Article Created: 28 April 1992

Article Reviewed/Updated: 23 July 1992

TOPIC -----

From a script, setting the sharedHilite of a background button to true, then setting the hilite of the button to true, then setting the sharedHilite for that button to false, prevents further script control of the button.

DISCUSSION -----

This series of steps may be followed if someone wants to quickly set several background buttons of a stack to hilite = true without having to visit each card individually. The button type and characteristics (show name, auto hilite, etc.) have no effect on this problem.

The only way to fix the button is to click on it with the button tool and change any of the button's characteristics in the button info dialog box. The button hilite will once again respond to script control until the above steps are repeated.
