Chinese Language Kit:Enable WorldScript Before Installing (5/96)

Article Created: 14 May 1996

TOPIC -----

I have a Power Macintosh 7200 computer, and I am having difficulty installing the Chinese Language Kit. Following the instructions in the Power Macintosh 7200 and 9500 Series ReadMe file, I first installed the WorldScript Updater 1.0, then I installed the Chinese Language Kit version 1.1 and the Chinese Language Kit Updater. I even disabled the extensions using the Extension Manager control panel before installing the Chinese Language Kit so that they would not interfere with the installation process. However, when I restarted the computer after completing the installation, the computer locked up. What could be causing this to happen?

DISCUSSION -----

From your description it is likely that you disabled the WorldScript extensions before you installed the Chinese Language Kit. By doing this, the Chinese Language Kit installer did not recognize that you had a later version of WorldScript already installed so it installed WorldScript 1.0, which is not compatible with your computer.

To resolve this, restart the computer, enabling the WorldScript and System extensions in the Extensions Manager. Then, reinstall the Chinese Language Kit and Updater.
