TOPIC -----

I use both System 7 and A/UX. Do I need to update to MacX 1.1.7?

DISCUSSION -----

If you are running MacX with A/UX, you do not need to upgrade to MacX 1.1.7. MacX has been included in A/UX since version 2.0.1 (March 1991). The next version of A/UX, which will include support for System 7, will incorporate MacX 1.1.7.

MacX 1.1.7 is the latest version of Apple's X Window System display server for the Macintosh operating system. It provides X Window System access and functionality for Macintosh computers in multivendor environments. MacX 1.1.7 provides an integrated computing environment with simultaneous access to Macintosh and X applications and the ability to cut and paste color graphics and text between them.

MacX 1.1.7 provides support for System 7. MacX users can take advantage of System 7 functionality, like Virtual Memory. This new capability expands the computer's memory through software, so that Macintosh users can run more and larger applications. MacX 1.1.7 is required for running MacX with System 7.

In addition, X11 for A/UX, Apple's complete X development environment replaces X Window System for A/UX, which used to incorporate MacX. You can use this product, which includes client applications, libraries, and tools for X Window System development. X11 for A/UX includes the software on both floppy disks and CD-ROM discs.
