PostScript: How To Create PostScript Text Files

Article Created: 14 June 1991
Article Last Reviewed: 15 July 1992

TOPIC -----

I want to output PostScript files from my Macintosh to a VAX. I plan to use a conversion utility to interpret the PostScript file and translate it into SIXEL graphic data for output to a laser printer.

How do I get the Macintosh to create this PostScript text file?

DISCUSSION -----

Here's how to print a PostScript image "to disk" rather than to a printer:

First, use the Chooser to select a LaserWriter. Then, choose Print... from the File menu.

Under System 7, click "PostScript File" instead of "Printer" in the Destination option of the Print dialog, and click Okay.

Under System 6, click Okay, then immediately hold down the Command key and press either:

- The "K" key (to dump a PostScript image with LaserPrep), or
 - The "F" key (to dump PostScript without LaserPrep).
- Hold the keys down until you see the Print Status dialog box.

A text file will appear containing the PostScript text.
