AppleShare: It Cannot Limit Access By Location

This article last reviewed: 9 February 1988

The AppleShare server is designed to limit access by individual, not by geographical location. So it's not possible, for example, for an individual user to have differing access privileges depending on which workstation he's using at the moment.

Once networks are connected, it's not possible through AppleShare or the Chooser to limit inter-network access. Unless you're using a mail system or other system communication that requires inter-network access, it may be best not to connect your networks.
