## MacPascal: Problem with Text Window Output option

This article last reviewed: 9/1/87

With MacPascal's "TEXT WINDOW OUTPUT" option, programs outputting to a text file may put garbage in the text file when writeln's are used for output.

Here's a workaround: open text output files under program control.

The program may be printing an undefined variable, probably a string variable. Double check your program for improper variable use. If you determine that this is not the problem, it is possible that you have run across a bug reported in versions of MacPascal.
