System 7: Video Memory Allocation

Article Created: 13 December 1991

Article Change History

08/25/92 - REVISED

- To make clear that holding down the option key still has a role in the System 7 Monitors control panel.

TOPIC

I recently upgraded my Macintosh IIci to system software version 7.0. Under version 6.0.X, when I wanted to change the memory allocation for the built-in video, I used this procedure:

- 1) In the Control Panel, I selected the Monitors cdev.
- 2) I pressed the Option key and clicked the "Options..." button.

A dialog box appeared, and in the bottom portion of the dialog box, labeled "Memory Allocation For Built-In Video", there were radio buttons for setting how much memory to allocate to video.

Is this still the correct method for System 7?

DISCUSSION

Under system software version 7.0, you no longer need to press the Option key. Just click the "Option..." button in the Monitors control panel to display the dialog box.

If you do hold down the Option key when clicking the "Option..." button in the Monitors control panel, you are presented with an option to "Use Special Gamma" for applications where accurate color representations are essential, or in situations where two different types of monitors are used whose colors must match.
