System Software: Network Install Not Supported Before System 7

Article Created: 9 October 1992

TOPIC ---

I'm having difficulty with installing system software on a large AppleTalk
network. I'm using Installer 3.2 and trying to install System 6.0.8.

I've never been able to install System 6.0.8 using the network installation
feature of the Installer. The System 6.0.7 network installation worked
sporadically. When an installation failed, the error message was always
"The Installer can not find the resources necessary for this installation.
Please contact your network administrator." or something like that. I've
checked access privileges and pathnames, and everything is correct.

DISCUSSION ---

System Software network installation is supported beginning with
System 7.0. You're trying to use the Installer (v3.2) from System 7.0 with
an installer script from System 6.0.8, which doesn't support network
installs. Technically, it might be possible to create an appropriate
script, but it's neither supported nor recommended.
