- For technical accuracy.

TOPIC -----

We've had problems installing system software version 7.0.1 with a NEW Apple Ethernet board installed in the Macintosh. Here's what happens:

- 1) Upon clicking the installer, we don't get the list of EtherTalk drivers, and we have to choose customize.
- 2) After completing the installation, the system doesn't work with the new board. We then use the disk that comes with the Ethernet board to install the drivers and A/ROSE.
- 3) The driver from this disk doesn't work with version 7.0.1, so we must again use the 7.0.1 disk to install the correct Ethernet driver.

Can you suggest a better way to do this?

DISCUSSION -----

To get the Ethernet NB card installed and working:

- 1) Install system software version 7.0.1.

Note: You must have the Macintosh connected to a working network before the driver lets the user services become active.

- 2) Then use the disk that ships with the Ethernet NB card (version 2.5.1) to install the Ethernet driver.

- 3) Restart the Macintosh.
