System 7.5.x: Must Choose Printer to Use Ofoto 2.0.x (2/96)

Article Created: 9 February 1996

TOPIC -----

I have recently upgraded to System 7.5.1 on my Macintosh computer. When I try to access any of the functions like Preview or Autoscan in Ofoto 2.0.x, I get a message that says "Couldn't complete the last command because of a Mac OS error. Result Code = -39".

I have received this same error when using the Extensions Manager to disable all extensions not necessary to run Ofoto.

DISCUSSION -----

You must have a printer selected in the Chooser in order for Ofoto to run properly. Follow these steps to select a printer:

Step 1

Choose the Chooser under the Apple Menu.

Step 2

Click to select your printer's driver in the left side of the Chooser.

Step 3

Click to select the modem or printer port on the right side of the Chooser, or select the name of your AppleTalk printer.

Step 4

Click the close box in the upper left corner of the Chooser.

You can now use all of Ofoto's functions.
