MacTCP DNR and System 7.5 Update 2.0 (4/96)

Article Created: 20 April 1996

TOPIC ---

After installing System 7.5 Update 2.0 on my Power Macintosh 8500, I noticed the
file "MacTCP DNR" in the System Folder. I'm not sure whether it was there
before. Also, I have the same thing on my Power Macintosh 7500. As I recall,
MacTCP DNR was a preference type file before installing System 7.5 Update 2.0.
Now the icon is different, and the file type is listed as Control Panel. Double
clicking on it says that it is used by MacTCP.

Do I need the MacTCP DNR file, and what does it do?

DISCUSSION --

MacTCP DNR is a special file for TCP application written for System 6.0.x that
contains resources that the application needs to use TCP. It's placed at the
root level of the System Folder because older applications expect it to be
available there, like older System 6.0.x control panels.

The file type/creator may have changed to control panel to reflect it was a
control panel under System 6.0.x. You should leave the file installed in the
event you come across an older TCP application that requires it.
