HFS: Running applications under the Hierarchial File System

Some applications have difficulty accessing their files when stored on an HFS volume. If an application has trouble finding files, try storing the files in one of the following locations:

1. root level
2. system folder
3. in the folder containing the application
4. on a MFS diskette/volume containing the application.

Some applications may not work with the HFS at all. In these cases, contact the software company to find out if there is a workaround or when their product will be revised to work with HFS.
