System 6.0: Old Smart Alarms and Macromaker Incompatibility

This article last reviewed: 2 August 1988

Some users may have had problems copying of files while running Macromaker under System v6.0.

One common problem occurs when the file name starting with a "." is reached. At this point, the Finder disappears and then restarts. The file with the "." is partially copied, and cannot be deleted until the system is rebooted.

This problem may be due to vestigial resources from Smart Alarms residing within the system. Many people used Smart Alarms until compatibility problems began to appear with System v5.0, and the remaining resources can cause even greater incompatibility difficulties with System v6.0.

One solution is for anyone who has previously used Smart Alarms to completely replace their system file.

However, Imagine Software has also made an inexpensive update for Smart Alarms which allows System v6.0 to function smoothly.
