## Chooser: How Device Lists Are Sorted

Article Created: 26 March 1991

Article Last Updated:

TOPIC -----

What determines the order that items appear in the Chooser's scrolling fields?

DISCUSSION -----

The Chooser broadcasts a signal to the entire network (or zone, if applicable) requesting that all devices of DEVICETYPE respond with their network information. The order in which those devices respond determines their order in the selection list. (A lightly-loaded network almost always returns the devices in the same order, because the devices aren't too busy to respond to the Chooser immediately.)

The order in which zone names are listed depends on the router you're using. Because this information is usual not dynamically compiled, most routers sort the list alphabetically for readability.
