Apple System Profiler On A Power Macintosh 7600/120 (6/96)

Article Created: 11 June 1996

TOPIC ---

When I used the Apple System Profiler (ASP) 1.0 on my Power Macintosh 7600/120,
it said that it was a Power Macintosh 7600/100.

Since I upgraded to the latest version of ASP, version 1.0.1, it now says that
my Macintosh is simply a "Power Macintosh."

Since neither ASP version 1.0 or 1.0.1 seem to be able to identify my computer,
which version should I be using?

DISCUSSION --

Apple System Profiler version 1.0.1 was written to support the new Enhanced
PCI-based Power Macintosh computers* including the Power Macintosh 7600/120.

However, Apple Engineering is aware that version 1.0.1 still does not properly
identify the Power Macintosh 7600. Apple intends to address this issue in the
next release of Apple System Profiler.

*NOTE: The enhanced PCI-based Power Macintosh computers include the following
computer series:

- Power Macintosh 7200/120
- Power Macintosh 7600/120
- Power Macintosh 8500/132
- Power Macintosh 8500/150
- Power Macintosh 9500/150
