## Energy Saver: Saving Preferences (3/97)

Article Created: 3 March 1997

Article Reviewed/Updated: 4 March 1997

TOPIC -----

My Energy Saver software doesn't appear to be working properly. I used the Energy Saver control panel to schedule a specific shutdown time. The computer shuts down automatically, but not at the time I designate. What's wrong?

DISCUSSION -----

The Energy Saver software is not saving your request correctly. This can occur if the control panel is closed while displaying the "Scheduled Startup & Shutdown" options in Energy Saver's window. There is a workaround. Follow these steps to ensure your startup and shutdown settings are saved:

### STEP ONE

-----

Open the Energy Saver control panel. Set startup and shutdown times for the computer as desired.

### STEP TWO

-----

Click the "Sleep Setup" button in the Energy Saver control panel window.

### STEP THREE

-----

Close the Energy Saver control panel.

This issue will be addressed in a future revision of the system software.
