Find File Does Not Have Enough Memory (2/97)

Article Created: 3 March 1997

TOPIC ---

When attempting to do a simple file name search with Find File I get a "not
enough memory" message. I have 40 MB of physical RAM, virtual memory is off, and
the operating system is taking up about 10 MB of RAM. Prior to getting this
error, I had set the find file desktop pattern to the blue plaid pattern in the
desktop patterns control panel. I decided to remove the desktop pattern from
Find File, and the not enough memory message went away. How can change the
pattern in Find File and have enough memory?

DISCUSSION --

Using a desktop pattern on the Find File utility does use a bigger portion of
Find File's available memory. To workaround this, increase the memory for the
Find File utility because it is actually an application.

To increase the memory for Find File:

Step 1

Make sure you have Quit the Find File utility.

Step 2

Open the Apple Menu Items folder in the System Folder

Step 3

Highlight the Find File utility and select Get Info from the File menu

Step 4

Increase the Preferred memory size to 560.

Step 5

Close the Find File Info window.
