Apple High-Resolution RGB Monitor: Troubleshooting Fading Screen

Article Created: 13 August 1991

TOPIC -----

My Apple 13-inch High Resolution RGB monitor's screen is blank, although the power light is on. When I take the shield off the back (covering the back of the CRT) the monitor works okay. When I put the shield back on, the picture fades. I have tried putting electrical tape all over the inside of the shield and the same thing happens.

DISCUSSION -----

We have a couple of suggestions for you:

- 1) Check the connections at H1 and H2. If they look damaged or borderline, resolder them and reinstall the cover.
- 2) Check the routing of the wires going through the Video H board, the long vertical board on the back of the monitor with the adjustments on it. There is a notch where the wires should go through. Verify they are routed properly.
- 3) With an insulated dittle stick, check the wires to see if one of them is pinched. Correct the pinched wire if necessary. If not, replace the Video B board.
