International System Software Install: No Special Requirements

Article Created: 21 June 1993

TOPIC ---

I'm trying to use Apple's Russian system software. I get the "Welcome to
Macintosh" startup screen, and then it crashes.

I have these questions:

1) Is the Russian version designed only to work with foreign ROMs?

2) The Installer isn't displaying English or Russian fonts, but a variety
   of squares and garbage. Is there any way to run the installation in
   Russian?

3) Does Apple have a HOW TO?

DISCUSSION --

Here are the answers to your questions:

1) There are no country-specific ROMs, and "international" Macintosh
   system software requires no special hardware.

2) To run the installation in Russian, "boot" from Install 1 of the
   Russian system disks. Everything will be displayed in Russian,
   including all of the instructions in the Installer. This applies to
   most, if not all international Macintosh system software.

3) Installation of international Macintosh system software 7.x is through
   the standard Installer application, so there are no special steps that
   you need to take.

In regard to the crashing problem, it seems that the system didn't get
installed properly. If you need the disk images for Russian System 7.1,
they're on the April '93 Developer CD.
