TOPIC -----

The new Peripheral Interface Guide (Cables section, Video Cables, page 11) suggests that the Macintosh LC video port supports Apple's Portrait Display. Is this correct?

DISCUSSION -----

The information in the Peripheral Interface Guide is incorrect and will be revised. In addition, Apple does not manufacture a video card/connector for the Macintosh LC that supports Portrait Display.

We know of two companies that manufacture video cards and connectors, for the Macintosh LC, that support the Portrait Display: the DisplayServer LC, by Lapis Technologies; and the Spectrum/8 LC, by SuperMac Technology.

For contact information, search the Tech Info Library under "Lapis" and "SuperMac".
