Macintosh Display Card 24AC: Sync on Green Output (2/94)

Article Created: 22 February 1994

* RESTRICTED: Apple Internal and Support Providers Only *
Not For General Public Release

TOPIC -----

Does the 24AC video card send a sync-on-green signal, or is there no sync-on-green, like the Macintosh AV computer's built-in video?

DISCUSSION -----

The Macintosh Display Card 24AC is software programmable and has the ability to send or not send a sync-on-green signal. The card senses the Macintosh monitor connected to it and only sends a sync-on-green signal to the following Macintosh monitors:

- HighRes RGB
- Macintosh Color Display
- Performa series displays
- Color Plus display

All other Macintosh monitors receive a no sync-on-green signal.
