PATHWORKS for Macintosh: Available Tools & Ethernet Support

Article Created: March 9, 1991

TOPIC ---

I'm trying to get an account a terminal session to their DEC using
MacTerminal 3.0. Their Macintoshes connect via AppleTalk and have a
gateway to Ethernet via the Shiva FastPath product. How can they get their
DECnet, 'ADSP'?

Is there a VT340 or a Tek 4105 Tool? A posted list of available tools
would be helpful!

What 10BASE-T Ethernet cards does PATHWORKS support?

DISCUSSION --

It is not clear if the account has PATHWORKS for Macintosh installed. If
they do, all the components for DECnet software and ADSP should be there.
They must configure the Shiva FastPath to support DECnet and install and
configure DECnet on the Macintosh.

To our knowledge, there is no VT340 Tool or Tektronix 4105 Tool. Version
3.5 of VersaTerm-Pro supports the Tek4105 terminal emulation, but not in
the forms of Tools.

We'll try to post tools developed by Apple and third-parties as they are
available. We have not heard of too many tools besides the ones provided
with the PATHWORKS package and a few others from third-parties. For
example, Synergy is now offering a Telnet Tool, an FTP Tool, and a generic
Driver Tool.

PATHWORKS for Macintosh should work with Apple's new Ethernet LC card and
the 10BASE-T adapter. We don't know of any tests done with third-party
cards. We have heard that another customer site did some preliminary
testing with Asante and Cabletron products, and found that PATHWORKS had no
problems with them.
