TechStep: Mismatched & Misconfigured In RAM Test Results

Article Created: 13 April 1992

TOPIC ---

What do "Mismatched" and "Misconfigured" mean in Apple TechStep RAM size
test results?

DISCUSSION --

"Mismatched" means that a given bank contains more than one size of SIMM.
When this is detected, the RAM size test puts a question mark ("?") after
the RAM size.

"Misconfigured" means that RAM bank A holds less memory than bank B.

Note

The Macintosh Classic cannot be misconfigured because bank A is soldered to
the logic board; therefore, it will not report a "Misconfigured" result.
