## Apple Media Tool 2.x: Setting QuickTime VR Correction (12/96)

Article Created: 19 December 1996

TOPIC -----

I have created my own QuickTime VR movies using the Apple Media Tool (AMT) 2.0. When I play them with the QTVR Player, I have the option of selecting No Correction, Partial Correction, or Full Correction. I prefer No Correction, however when running the QTVR movies in AMT, some kind of correction is being performed. Is there a way to change the default correction in Apple Media Tool?

DISCUSSION -----

Version 2.0 of AMT does not allow you set the level of correction -- it defaults to full correction. However, AMT 2.1.1 allows you to set the correction level, similar to the way that the QTVR Player does.

To set the correction level using AMT 2.1.1, do the following:

Step 1

-----

Add a QuickTime VR panoramic movie as a media element.

Step 2

-----

Designate the movie as panoramic (click and hold until the menu appears)

Step 3

-----

Double-click on the movie, the correction setting is available at the bottom of the dialog.
