Peter & Santa Claus CD: Memory Alerts (12/93)

Article Created: 7 December 1993

TOPIC ---

1: When trying to run Peter & Santa Claus, why does an alert
   appear saying that there's not enough memory?

2: Why do I get an alert saying, "The application 'Peter and Santa Claus
   has unexpectedly quit (out of system memory)?"

DISCUSSION --

Answer to Question 1:
• Ensure that there is enough memory available by choosing "About This
  Macintosh" from the Apple Menu and examining your largest unused block.
  Peter & Santa Claus requires at least 2300K of memory to run.
• Remove any extensions or control panels that create a low memory
  situation in the background (such as background compression utilities).
  This will decrease the amount of memory used by your system software and
  allow more memory for your CD application.
• If using Virtual Memory, restart the CPU to ensure that memory is not
  fragmented.
• Close all windows in Finder.
• Quit any running applications.
• If you still do not have enough memory, you may want to consider
  purchasing more.

Answer to Question 2:
• If you are running under System 6.0.7 MultiFinder and do not have over
  5MB of memory available, you will receive this alert.
• Peter and Santa Claus will run properly on a 4MB CPU if you switch over
  to Finder instead of MultiFinder.
