TOPIC -----------------------------------------------------------

Can I turn off the sound as something plays back?

DISCUSSION ------------------------------------------------------

Each QuickTime movie file can have any number of tracks within the file.
When the file is played, the application software explicitly "tells"
QuickTime which tracks to play.  For example, you could have a movie file
with one video track and one audio track for English narration, one audio
track for Spanish, another for German, and so on.

On playback, the application could check to see what language the System is
in, and  play only the appropriate audio track.  The application could also
play NO audio tracks if desired.  This functionality is an application
feature; QuickTime just offers the support for achieving it.
