A/UX and exportFS: Using With NFS (3/97)

=====  
Article Created: 14 March 1997

TOPIC -----

I want to use exportFS to NFS mount a Macintosh directory for sharing data. The Macintosh directory has spaces in the name which export can use, and the \ and " characters are reserved for other operations in the /etc/exports file. How can I export this directory?

DISCUSSION -----

Create a symbolic link (ln -s) for that directory, called shared\_data or equivalent name, that is one with no spaces. Then export the symbolic link instead of the original directory.
