CFM-68K Runtime Enabler 4.0: Final Version Read Me (3/97)

===

Article Created: 19 March 1997

TOPIC ---

This article is the CFM-68K Runtime Enabler final version, "How to Install
CFM-68K" Read Me file.

DISCUSSION --

Update: CFM-68K Runtime Enabler final version now available for download!

Apple Computer has released version 4.0 of the CFM-68K Runtime Enabler
extension. This extension fixes a problem with earlier versions of this
extension which could result in application instability and loss of data.
Because of the potential quality impact of this problem, Apple strongly
recommends that customers with earlier versions of this extension upgrade to
version 4.0.

To determine what version of the extension you have installed on your computer,
perform the following steps:

 1) Open your hard drive by double clicking it.

 2) Open your System Folder by double clicking it.

 3) Open you Extensions Folder by double clicking it.

 4) Select the " CFM-68K Runtime Enabler" file. Note that this file begins
    with a space.

 5) Choose Get Info from the File menu.

 6) The version number is listed next to the Version heading.

 7) If the version number is less than 4.0, you should replace the

extension with version 4.0, using the following directions.

(This is not part of the Read Me file. NOTE: If you are using CFM-68K
Runtime Enabler 4.0b1 Beta software, you should replace the extension
with version 4.0.)

8) Select the file ObjectSupportLib and Choose Get Info from the File
menu.

9) If the version number of the file is less than 1.2, you need to
replace it with the newer version.

10) Drag ObjectSupportLib and CFM-68K Runtime Enabler from your Extensions
folder onto your Desktop. If you had previously removed the CFM-68K
Runtime Enabler, then drag only ObjectSupportLib onto your Desktop.
The ObjectSupportLib file must be out of your Extensions folder, but
cannot be thrown away or replaced because it is in use. After you
restart your computer, you can drag the ObjectSupportLib file from the
Desktop to the Trash.

11) Locate the folder "CFM-68K 4.0 folder" and double-click it to open it.

12) Drag the two files " CFM-68K Runtime Enabler" (note this begins with a
space), and "ObjectSupportLib" into the Extensions folder in your
System Folder. Important: Dragging these files onto the System Folder
itself may not route them to the correct location. Both need to be in
the Extensions folder.

13) Restart your computer.

14) Verify that you have the correct versions installed by repeating steps
1 through 9.

15) Drag the older versions of the files from your desktop to the Trash.
