AppleCD SC Audio: Entering Song and Disk Titles

This article last reviewed: 21 February 1989

Some of you have experienced a problem with AppleCD SC using the v2.0.1
Installer Disk:

You enter the CD Name and Tracks and then save them (this loads the data
into CD Remote Programs file). Then, when you insert the CD back again, the
Track names do not show up (as they did with Installer v1.0). Also, Audio
CD is named Audio 1, Audio 2, etc., each time the same CD is removed and
inserted.

The song and disk titles are saved in the "CD Remote Programs" file in the
System Folder. The entry in the CD Remote Programs file is cross-referenced
against total time of audio, number of tracks, length of tracks, and
various other unique characteristics of individual audio CDs. There are
three resources in the "Programs" file: "IndX", "Program", and "STR#":

- "IndX" is the cross reference between the CD and the file.

- "Program" contains the sequence, if programmed, for playback of the
tracks.

- "STR#" contains the song and disk titles.

This cross-reference scheme lets you type variations of the disk and song
titles. The CD ID (IndX) is used to access the correct titles (STR#) and
programmed sequence (Program).

The naming of the desktop's audio CD icon is based on an evaluation of
total time, individual track lengths, and various other unique aspects of
an individual audio CD. If you eject an audio CD (as opposed to dragging it
to the trash), the system software may recognize an audio CD that played
earlier. Otherwise, a counter is incremented and the name becomes "Audio _"
(the "_" portion of the name being the incremented number). Thus, the
sequence of Audio 1, Audio 2, Audio 3, and so on is to be expected.
