Macintosh: Displays Greater Than 72 dpi Not Yet Available

This article last reviewed: 6 March 1990

TOPIC -----

I want to implement scanned documents in conjunction with electronic mail. The scanned documents look good when printed but not as nice when viewed on the screen at 72 dpi. I need video cards and monitors that work at 100 or 150 dpi, but I cannot find anything other than 72 or 75 dpi. I don't want to change scale, just resolution.

Can you help?

DISCUSSION -----

As of February, 1990, we don't know of any display system for the Macintosh that provides a resolution higher than 72 dpi without decreasing the size of the displayed image in direct proportion to the increase in resolution. In other words, the higher the screen resolution, the smaller the displayed image. Copyright 1990 Apple Computer, Inc.
