Nine-Inch Color Monitor for Macintosh

This article last reviewed: 6 March 1990

TOPIC -----

I am using a Macintosh as the front end to a new product that will be used in an automobile. I need a 9-inch color monitor with the Macintosh and have located a unit from DisplayTek that has a vertical scan rate of 60Hz or 70Hz (selectable to one or the other only, not adjustable in a range) and a horizontal scan rate or 31.5KHz.

The horizontal can work +/- 0.5KHz from nominal. Is there a video board that works with these specifications? I have been told that an early version of the SuperMac video card might be able to work. As an alternative, is there another 9-inch monitor that I can suggest to them?

DISCUSSION -----

Princeton Graphics makes a 9-inch multisync monitor on a special-order basis only. This monitor should work properly with the Macintosh II video card. For more details, search the Technical Info library under "Princeton Graphic." Copyright 1990 Apple Computer, Inc.
