Macintosh 12-inch RGB Display

This article last reviewed: 16 October 1990

TOPIC -----

This article describes the Macintosh 12-inch RGB Display, introduced 15 October 1990.

DISCUSSION -----

Not all Macintosh video sources will support the Macintosh 12-inch RGB Display. The following Apple video outputs support this monitor:

- Macintosh Display Card 4/8 and 8/24 video card
- Macintosh IIci built-in video
- Macintosh LC built-in video
- Macintosh IIsi built-in video

All previous video cards do not work with the Macintosh 12-inch RGB Display. At the time these cards were developed, the timing for the 12-inch RGB was not known and, therefore, does not support the proper video signaling.

In addition, the Macintosh Display Card 8/24 GC card does not work with the Macintosh 12-inch RGB Display. The card is designed for high-end systems, and the 12-inch RGB Display for inexpensive systems.
