Macintosh 12-Inch RGB Display: Compatible Systems

Article Created: 4 June 1991

Article Last Reviewed: 24 April 1992

Article Last Updated: 24 April 1992

TOPIC -----

I have a problem driving the Macintosh 12-Inch RGB Display with an 8-bit video card in a Macintosh IICx.

DISCUSSION -----

Not all Macintosh video sources support the Macintosh 12-Inch RGB Display. The following Apple video outputs support this monitor:

- Macintosh Display Card 4•8 and Macintosh Display Card 8•24
- Macintosh IICi built-in video
- Macintosh IISi built-in video
- Macintosh LC built-in video
- Macintosh LC II built-in video

All previous video cards do not work with the Macintosh 12-Inch RGB Display. At the time these cards were developed, the timing for the Macintosh 12-inch RGB Display was not known and, therefore, does not support the proper video signaling.

The Macintosh Display Card 8•24 GC does not work with the Macintosh 12-Inch RGB Display. The card is designed for high-end systems, and the Macintosh 12-Inch RGB Display is for inexpensive systems.
