Macintosh: Using Monitors Control Panel To Add/Change Display

Article Created: 20 January 1993

TOPIC ---

When I added a Macintosh Portrait Display to my PowerBook, I couldn't move the
mouse pointer to the new display.

DISCUSSION ---

Open the Monitors control panel, click on the picture of the Portrait Display
you see there, then close the control panel. This updates the 'scrn' resource
in the System file, so when the PowerBook is starting up, it is aware of the
external monitor and adds it to its "display space."

This is not specific to the Portrait Display: if you set up a PowerBook to work
with a Portrait Display, then connect the PowerBook to a different display,
you'll have to go through the same process again.

You can also see this on other Macintosh models if you switch between
displays on a single video card installed in a Macintosh.
