Security Lock Ports on Apple Displays (2/95)

```
Article Created: 1 February 1995

TOPIC -----------------------------------------------------------

What type of security lock ports do the Apple displays have and where are they
located?

DISCUSSION ------------------------------------------------------

Security lock ports are used to physically lock Apple displays to a desk or
other stationary object using some kind of cable locking system.

Apple generally uses four different types of security lock ports on their
hardware products. They are as follows:

PORT TYPE                   DESCRIPTION
---------------------       --------------------------------------------
Large rectangular port      This security port is a rectangular port that
                            measures approximately 6mm x 35mm at the
                            opening.

Small rectangular port      This is a slightly smaller rectangular port.
                            It measures approximately 6mm x 22mm at the
                            opening.

1/4" Mini-slot port         This is the most recent security lock port.
                            This port is a small, 3mm x 7mm, opening
                            without latches of any kind. It uses a
                            different type of security device than the
                            previous security lock ports.

Cable Slotted port          This is a plastic loop on the bottom of the
                            unit that is intended to have a security
                            cable fed through it.

Use the following chart to determine which type of security device you need for
your Apple display.

***NOTE***  Generally, security lock ports are located on the back panels of
most Apple displays or, in the case of the cable slotted port, on the bottom
panels.
