Macintosh: Why Some Models Have Two Keyboard Ports (2/93)

Article Created: 9 February 1993

TOPIC -----

Why does my Macintosh have two, rather than just one, socket for the keyboard cable?

DISCUSSION -----

Some Macintosh models have two ADB (Apple Desktop Bus) ports, so you can either:

- Plug the keyboard and the mouse directly into the computer, or
- Plug the mouse into the keyboard and then the keyboard into the computer. (You can plug the keyboard into either port.)
