Apple Tape Backup 40SC: Priority number

This article last reviewed: 9 March 1987

SCSI device users have available eight priority numbers, 0 through 7. The Macintosh is always assigned number 7. An internal hard disk is always assigned 0. That leaves 1 through 6 to assign to your tape backup unit or 0 thru 6, if you don't have an internal SCSI hard disk.

Though the manual recommends you use priority 1 for the Tape Backup 40SC and connect it to the last SCSI device in the chain, you can use any of the other priority numbers if they are not already used. You may place the tape backup unit anywhere else in the SCSI bus as long as it is properly terminated. For a more complete description on how to connect SCSI devices, refer to the manual, "The Apple SCSI Cable System."
